What's TensorFlow™?

- Open source software library for numerical computation using data flow graphs
- Originally developed by Google Brain Team to conduct machine learning and deep neural networks research
- General enough to be applicable in a wide variety of other domains as well

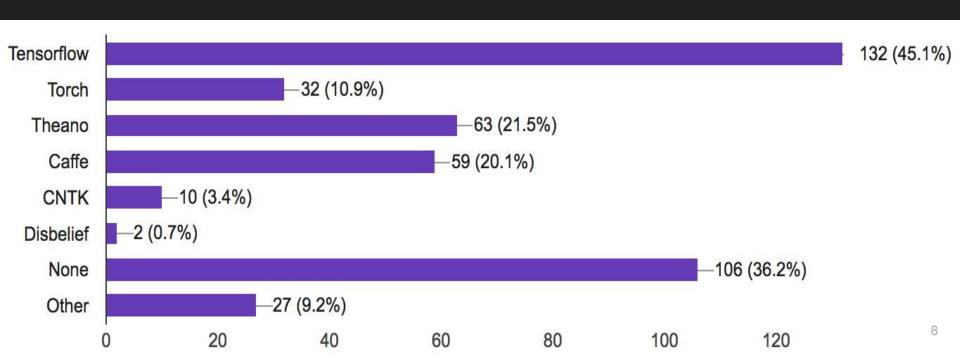

TensorFlow provides an extensive suite of functions and classes that allow users to build various models from scratch.

Launched Nov 2015

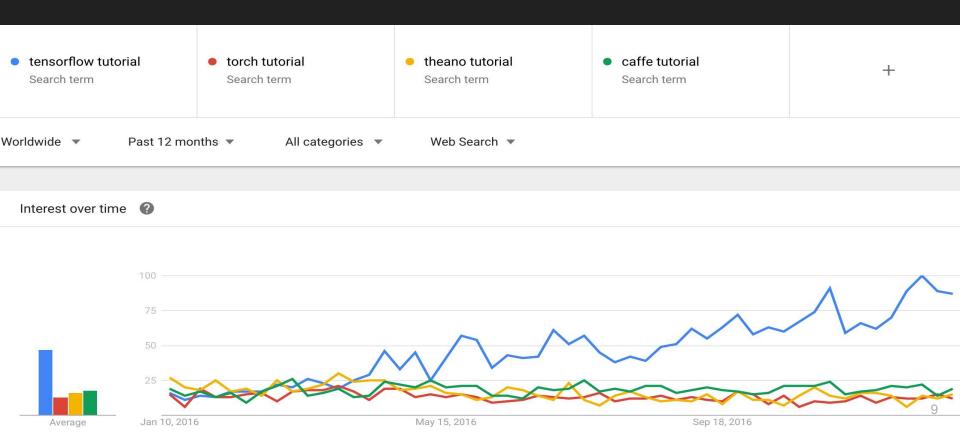

Jan 10 - Jan 16 2016 tensorflow Jan 10, 2016 May 1, 2016 Aug 21, 2016 Dec 11, 2016

TF is not the only deep learning library

From students signed up for this class

Why TensorFlow?

Why TensorFlow?

- Python API
- Portability: deploy computation to one or more CPUs or GPUs in a desktop, server, or mobile device with a single API
- Flexibility: from Raspberry Pi, Android, Windows, iOS, Linux to server farms
- Visualization (TensorBoard is da bomb)
- Checkpoints (for managing experiments)
- Auto-differentiation *autodiff* (no more taking derivatives by hand. Yay)
- Large community (> 10,000 commits and > 3000 TF-related repos in 1 year)
- Awesome projects already using TensorFlow

Companies using Tensorflow

- Google
- OpenAI
- DeepMind
- Snapchat
- Uber
- Airbus
- eBay
- Dropbox
- A bunch of startups

Some cool projects using TensorFlow

Neural Style Translation

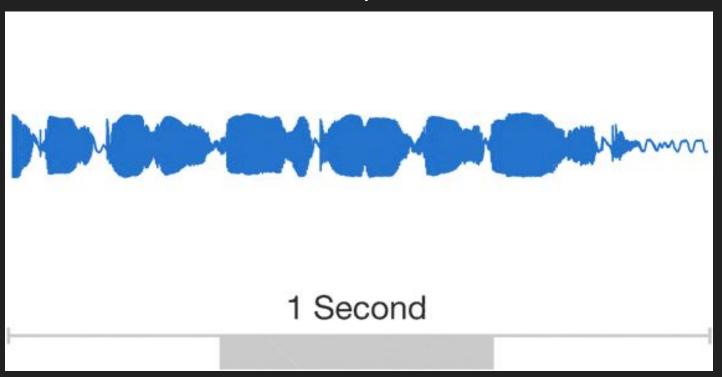

"Image Style Transfer Using Convolutional Neural Networks" by Leon A. Gatys et al. (2016) Tensorflow adaptation by Cameroon Smith (cysmith@github)

Generative Handwriting

Plout fou ous in freely the 1 Part for course in the Peor fou ous in fruit the 1 Plon fou ous in freely the 1

WaveNet: Text to Speech

It takes several hours to synthesize 1 second!

I hope that this class will give you the tool to build cool projects like those

Goals

- Understand TF's computation graph approach
- Explore TF's built-in functions
- Learn how to build and structure models best suited for a deep learning project.

Introduction

Logistics

- Piazza
- Emails: (cs20si-win1617-staff/cs20si-win1617-students/cs20si-win1617-guests)
- Assignments (3)
- Participation is a big chunk of grades
- A lot of you are ahead of me in your academic career so I probably need more of your help than you do mine . Feedback is greatly appreciated!

Books

- TensorFlow for Machine Intelligence (TFFMI)
- Hands-On Machine Learning with Scikit-Learn and TensorFlow. Chapter 9:
 Up and running with TensorFlow
- Fundamentals of Deep Learning. Chapter 3: Implementing Neural Networks in TensorFlow (FODL)

TensorFlow is being constantly updated so books might become outdated fast

Check tensorflow.org directly

Getting Started

import tensorflow as tf

Simplified TensorFlow?

- 1. TF Learn (tf.contrib.learn): simplified interface that helps users transition from the the world of one-liner such as scikit-learn
- 2. TF Slim (tf.contrib.slim): lightweight library for defining, training and evaluating complex models in TensorFlow.
- 3. High level API: Keras, TFLearn, Pretty Tensor

But we don't need baby TensorFlow ...

Off-the-shelf models are not the main purpose of TensorFlow.

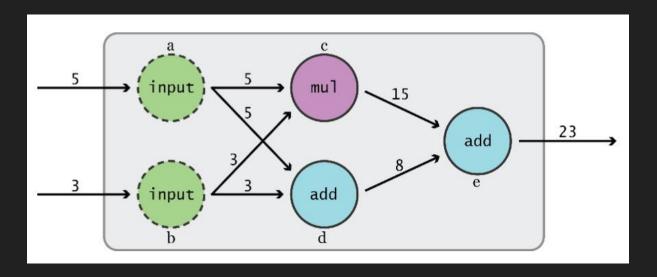

TensorFlow provides an extensive suite of functions and classes that allow users to define models from scratch.

And this is what we are going to learn.

Graphs and Sessions

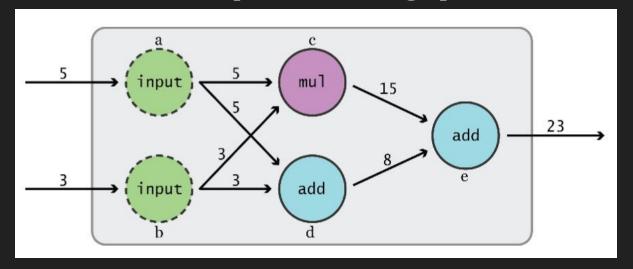

TensorFlow separates definition of computations from their execution

Graph by TFFMI

Phase 1: assemble a graph

Phase 2: use a session to execute operations in the graph.

What's a tensor?

What's a tensor?

An n-dimensional array

o-d tensor: scalar (number)

1-d tensor: vector

2-d tensor: matrix

and so on

import tensorflow as tf

$$a = tf.add(3, 5)$$

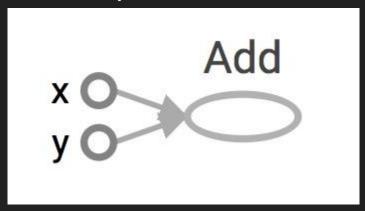

Why x, y?

TF automatically names the nodes when you don't explicitly name them.

$$x = 3$$

$$y = 5$$

Visualized by TensorBoard

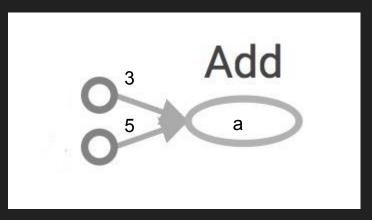

import tensorflow as tf

$$a = tf.add(3, 5)$$

Nodes: operators, variables, and constants

Edges: tensors

Interpreted?

import tensorflow as tf

$$a = tf.add(3, 5)$$

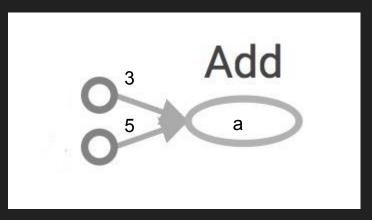

Nodes: operators, variables, and constants

Edges: tensors

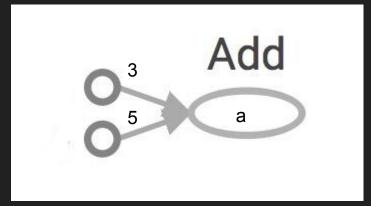

Tensors are data.

Data Flow -> Tensor Flow (I know, mind=blown)

Interpreted?

```
import tensorflow as tf
a = tf.add(3, 5)
print a
```

```
>> Tensor("Add:0", shape=(), dtype=int32)
(Not 8)
```

How to get the value of a?

Create a **session**, assign it to variable sess so we can call it later

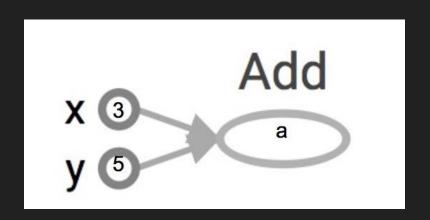

Within the session, evaluate the graph to fetch the value of a

How to get the value of a?

Create a **session**, assign it to variable sess so we can call it later

Within the session, evaluate the graph to fetch the value of a

```
import tensorflow as tf
a = tf.add(3, 5)
sess = tf.Session()
print sess.run(a)
sess.close()
```

The session will look at the graph, trying to think: hmm, how can I get the value of a, then it computes all the nodes that leads to a.

How to get the value of a?

Create a **session**, assign it to variable sess so we can call it later

Within the session, evaluate the graph to fetch the value of a

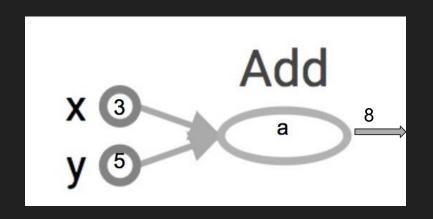

```
import tensorflow as tf

a = tf.add(3, 5)

sess = tf.Session()

print sess.run(a) >> 8

sess.close()
```

The session will look at the graph, trying to think: hmm, how can I get the value of a, then it computes all the nodes that leads to a.

How to get the value of a?

Create a **session**, assign it to variable sess so we can call it later

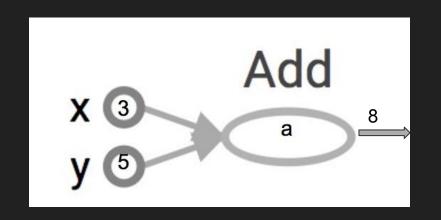

Within the session, evaluate the graph to fetch the value of a

```
import tensorflow as tf

a = tf.add(3, 5)

sess = tf.Session()

with tf.Session() as sess:
    print sess.run(a)
```

-sess.close()-

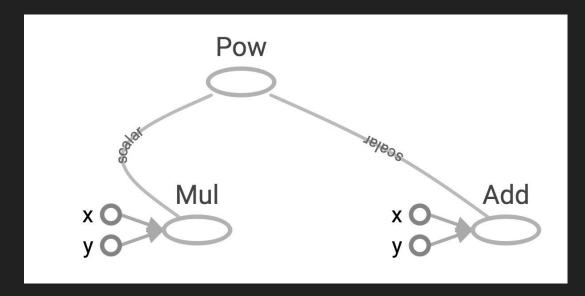

tf.Session()

A Session object encapsulates the environment in which Operation objects are executed, and Tensor objects are evaluated.

More graphs

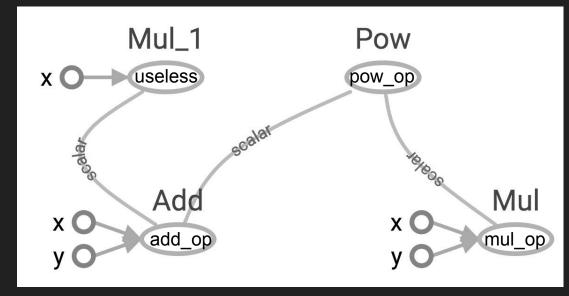

Visualized by TensorBoard

```
x = 2
y = 3
op1 = tf.add(x, y)
op2 = tf.mul(x, y)
op3 = tf.pow(op2, op1)
with tf.Session() as sess:
     op3 = sess.run(op3)
```

Subgraphs

```
x = 2
y = 3
add op = tf.add(x, y)
mul op = tf.mul(x, y)
useless = tf.mul(x, add op)
pow op = tf.pow(add op, mul op)
with tf.Session() as sess:
     z = sess.run(pow op)
```

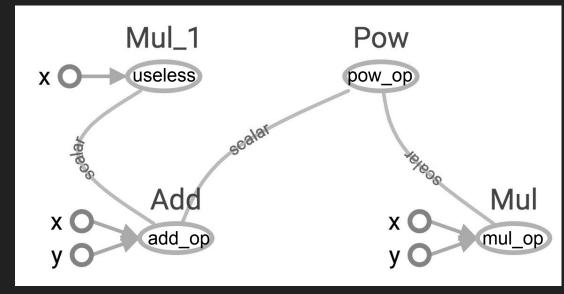

Because we only want the value of pow_op and pow_op doesn't depend on useless, session won't compute value of useless

→ save computation

Subgraphs

```
x = 2
y = 3
add op = tf.add(x, y)
mul op = tf.mul(x, y)
useless = tf.mul(x, add op)
pow op = tf.pow(add op, mul op)
with tf.Session() as sess:
```

z, not_useless = sess.run([op3, useless])

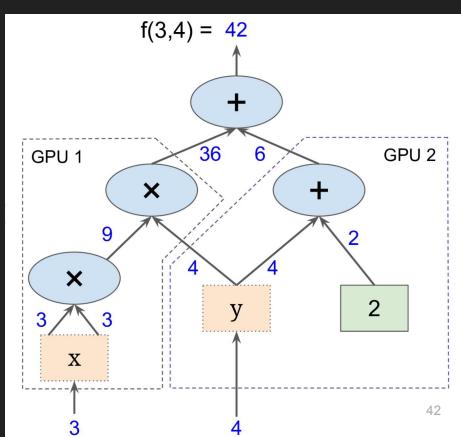

tf.Session.run(fetches, feed_dict=None,
options=None, run_metadata=None)

pass all variables whose values you want to a list in fetches

Subgraphs

Possible to break graphs into several chunks and run them parallelly across multiple CPUs, GPUs, or devices

Example: AlexNet

Graph from the book "Hands-On Machine Learning with Scikit-Learn and TensorFlow"

Distributed Computation

To put part of a graph on a specific CPU or GPU:

What if I want to build more than one graph?

You can but you don't need more than one graph The session runs the default graph

But what if I really want to?

URGH, NO

- Multiple graphs require multiple sessions, each will try to use all available resources by default
- Can't pass data between them without passing them through python/numpy, which doesn't work in distributed
- It's better to have disconnected subgraphs within one graph

I insist ...

```
create a graph:
```

```
g = tf.Graph()
```

to add operators to a graph, set it as default: g = tf.Graph() with g.as_default(): x = tf.add(3, 5)sess = tf.Session(graph=g) with tf.Session() as sess: sess.run(x)

to add operators to a graph, set it as default:

```
g = tf.Graph()
with g.as_default():
     a = 3
                                                   Same as previous
     b = 5
     x = tf.add(a, b)
sess = tf.Session(graph=g) # session is run on the graph g
# run session
sess.close()
```

To handle the default graph:

```
g = tf.get_default_graph()
```

Do not mix default graph and user created graphs

```
g = tf.Graph()

# add ops to the default graph

a = tf.constant(3)

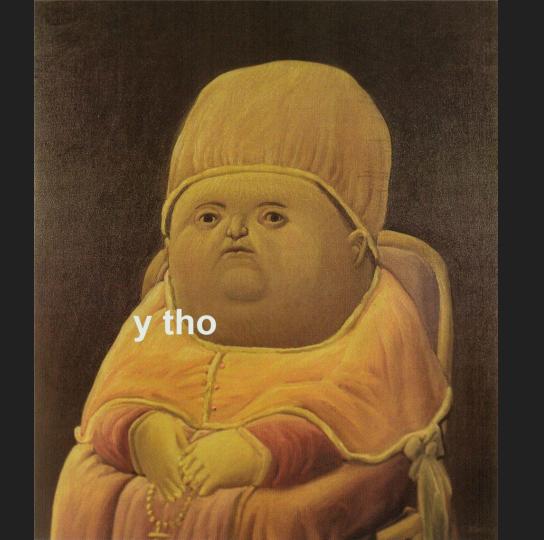

# add ops to the user created graph

with g.as_default():
    b = tf.constant(5)
Prone to errors
```

Do not mix default graph and user created graphs

```
g1 = tf.get_default_graph()
g2 = tf.Graph()
# add ops to the default graph
with g1.as default():
     a = tf.Constant(3)
# add ops to the user created graph
with g2.as default():
     b = tf.Constant(5)
```

Better
But still not good enough because no more than one graph!

Why graphs

- 1. Save computation (only run subgraphs that lead to the values you want to fetch)
- 2. Break computation into small, differential pieces to facilitates auto-differentiation
- 3. Facilitate distributed computation, spread the work across multiple CPUs, GPUs, or devices
- 4. Many common machine learning models are commonly taught and visualized as directed graphs already

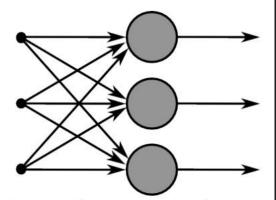

Figure 3: This image captures how multiple sigmoid units are stacked on the right, all of which receive the same input *x*.
